JIT Compiler

- ▶ Traditional bytecode interpreter is fast and it takes more memory
- ▶ Just-in-time (JIT) compilation is a way of executing computer code that involves compilation during execution of a program
 - ▶ Dynamic compilation strategy
- ▶ Continuously analyses the code being executed, identifies parts of the code where the speedup gained from compilation or recompilation would outweigh the overhead of compiling that code
- ▶ Performs optimizations

Specification of Token

- ▶ Regular expressions are an important notations for specifying patterns for lexemes
 - ▶ $letter \rightarrow A|B|\dots|Z|a|\dots|z$
 - ▶ $digit \rightarrow [0 - 9]$
 - ▶ $digits \rightarrow digit^+$
 - ▶ $number \rightarrow digits(.digits)?(E[+-]?digits)?$
 - ▶ $id \rightarrow letter(letter|digit)^*$
 - ▶ $if \rightarrow if$
 - ▶ $then \rightarrow then$
 - ▶ $else \rightarrow else$
 - ▶ $relop \rightarrow < | > | \leq | \geq | = | <>$

Specification of tokens

- ▶ A regular expression is a sequence of characters that define a search pattern.
- ▶ It is converted to finite automata for accepting the lexemes
